The amazing uses of paper

How can we make science in primary school with few means? That's the question I am about to answer with paper.

Through about ten experiments, I can talk about a lot of science subjects such as dissolution, toughness, light properties, capillarity, etc.

Paper is the material every teacher has in large quantity and the possibilities are nearly unlimited !

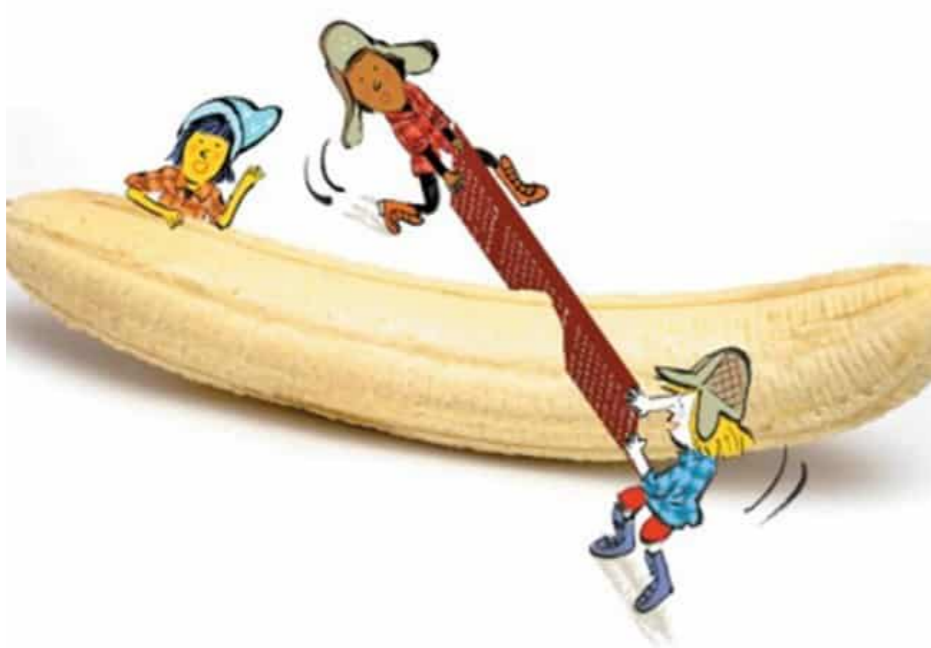

Dissolution

Capillarity

Paper knife

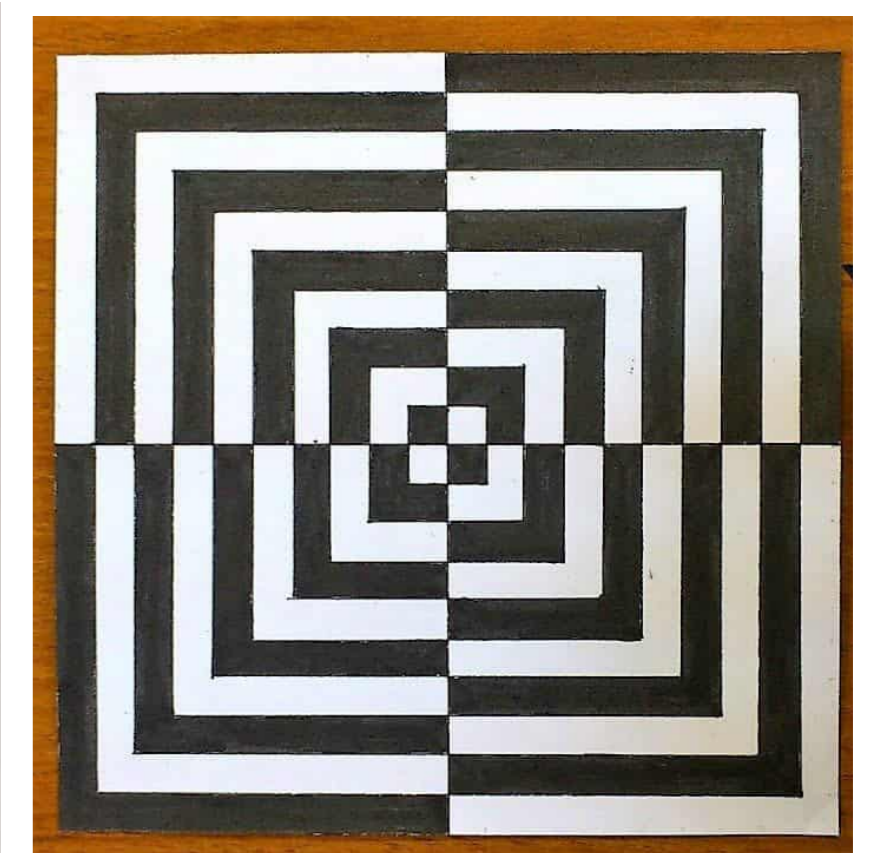

Paper windmill

Tealight holder

Optical illusion

Paper resistance

Newton's Disc Spinning Top

Paper can be solid as a rock, transparent as glass, absorbent as sponge, in short, paper has the ability to help children to find answers to their science searches in many ways.

Science rocks with paper and scissors !
