Hoist the sails!

Building a boat at school is not new, but this project is centered on vikings' and indigenous communities' ingenuity. The students discover at the same time the knowledge in sciences recieved as a legacy by the first nations of their country but also the handcraft methods developed since the last few thousand years.

All around the world, a bunch of countries have their own first nations. This projet is a great opportunity for the teachers , no matter where they teach, to talk about indegenious people and how their knowledge can be used in sciences not only at school but also on a daily basis. Their students could also discover some facts about the indigenous communities who used to live on the land they live on and who still live nearby.

Immerse yourself in a world where Vikings and the engineering of Canada's first Nations come together to create extraordinary prototypes of watercraft.
