## Our Friends, the Trees

### Interdisciplinary outside learning

Contact with nature can greatly influence the development of children. Through reading material and manipulation experiments, students will discover the fascinating world of trees.

This multidisciplinary project will allow students to use their five senses to acquire more concrete knowledge and become familiarized with various parts of trees and their different functions. After having completed the project, students will have the chance to identify different trees found in their neighborhood.

At the end of the project, the students will each have their personal folder in which they will have collected all their new information.

Nature is very beneficial, and students should be given the chance to explore it as much as possible. This project does just that!
