## The Universe

Meetings for primary and kindergarten scholars developed and executed for secondary education students

This work began with an exhaustive search of information related with the universe, focusing on the solar system and the bodies that make it to create two presentations on the universe. A model related to this topic was also made to present it graphically.

The first presentation was shown to the pupils of the first cycle of primary school of Santo Domingo de Silos school with the corresponding explanation of the model previously created and accompanied by a simulation experiment of the creation of craters on the moon and another experiment of creating a galaxy in a glass with which it was explained how a galaxy could look, what colours could form it and which contributed to making the explanation more entertaining and didactic at the same time.

A more complete presentation was also given to the second course of the ESO students of the same school
